Doppler Boilerplate

Doppler is the secrets manager built for the agentic age. One platform for every secret, human or AI. Developers, AI agents, MCP servers, and automated workflows all need credentials to reach your APIs, databases, cloud infrastructure, and internal services. Doppler gives every human and AI identity secure, centralized access to the secrets they need, whether you deploy on-prem or in the cloud. Its MCP server lets AI agents request secrets natively, without custom scripts or hardcoded credentials, and your cost stays flat whether you run 10 agents or 1,000. Every secret access is logged and traceable on a platform that's SOC 2 and ISO 27001 compliant.

Biography for Amber Brittion - Doppler CEO

150 Words

Amber Britton is the CEO of Doppler, the product-led secrets management platform used by tens of thousands of engineering and DevOps teams to securely orchestrate, govern, and manage secrets across environments at scale. An operator known for bridging product, growth, and revenue, she has helped shape Doppler’s strategy across both self-service and enterprise customers while building highly efficient go-to-market systems.

Amber stepped into the CEO role after leading Doppler’s go-to-market organization, where she built and scaled the company’s product-led growth engine and helped expand its enterprise sales motion. Her leadership helped drive strong growth in self-service revenue, enterprise pipeline, and net dollar retention while aligning product, engineering, marketing, and sales around a unified strategy for scaling the business.

Amber previously held growth and product leadership roles at SecurityScorecard and Movable Ink, while she also earned her MBA in Marketing from Stony Brook University. Long before running a startup, Amber won first place in the state of Oregon in FBLA for machine transcription, a now mostly obsolete skill.
